

Build a small **Accountant Hub** project, similar to Upwork, where companies post accounting jobs and accountants can browse jobs, view details, and apply with a bid.

Objective

We want to evaluate your ability to work as a **solo builder** who can think through the product, design the UI/UX, build the frontend, backend, database, and deploy the project.

You are responsible for:

- UI/UX thinking
- Frontend implementation
- Backend implementation
- Database structure
- API design
- Deployment
- Clean code and business logic

Task Description

Build a web application called **Accountant Hub**.

The platform should allow accountants to find accounting jobs and submit bids to complete those jobs.

Required Features

1. Jobs Listing Page

Create a page that displays available accounting jobs.

Each job card should show:

- Job title
- Company/client name
- Short description
- Budget range
- Deadline
- Job category
- Number of bids received
- Posted date
- Status: Open / Closed

The page should include basic filters such as:

- Search by job title
- Filter by category
- Filter by budget range
- Sort by newest / highest budget

2. Job Details Page

When the accountant clicks on a job, they should see a detailed job page.

The page should include:

- Full job description
- Client/company information
- Required skills
- Expected delivery time
- Budget
- Attachments placeholder, if any
- Existing bids count
- Apply / Submit Bid button

3. Submit Bid Flow

As an accountant, I should be able to apply for a job by submitting a bid.

The bid form should include:

- Proposed price
- Estimated delivery time
- Cover letter / proposal message
- Relevant experience summary

After submitting, the system should save the bid and show a success message.

The same accountant should not be able to submit more than one bid for the same job.

4. Basic Authentication

Create simple authentication for accountants.

Required:

- Register
- Login
- Logout

- Only logged-in accountants can submit bids

Admin/client authentication is not required, but you may seed sample jobs in the database.

Technical Requirements

Preferred stack:

- Frontend: React / Next.js
- Backend: Laravel
- Database: MySQL
- Deployment: Any live deployment method

You may use another stack only if you explain why.

Database Requirements

Suggested entities:

- Users
- Jobs
- Job Categories
- Bids

Important relationships:

- A job belongs to a category
- A job has many bids
- A user/accountant can submit many bids
- A user can submit only one bid per job

UI/UX Expectations

The design should be clean, modern, and easy to use.

We will evaluate:

- Layout quality
- Spacing and typography
- Mobile responsiveness
- Clear job cards
- Clear job details page
- Simple and smooth bid submission flow
- Good empty states and validation messages

Colors to use : Black , #019a51

Backend Expectations

We will evaluate:

- Clean API structure
- Proper validation
- Authentication protection
- Correct database relationships
- Preventing duplicate bids
- Proper error handling
- Clean and readable code

Bonus Points

- Dashboard page showing my submitted bids
- Job status handling: Open / Closed
- Pagination for job listing
- Better filtering and sorting
- Reusable UI components
- API Resources / clean response formatting
- Deployment with live URL
- README with setup instructions
- Seeded demo data

Deliverables

Please submit:

- GitHub repository link
- Live demo URL
- Test accountant login credentials
- README file including:
 - Project overview
 - Tech stack used
 - Setup instructions
 - How to run the project locally
 - API endpoints
 - Any assumptions made

Evaluation Criteria

We will evaluate you based on:

- Product thinking
- UI/UX quality
- Frontend implementation
- Backend implementation
- Database design
- Code organization
- Business logic correctness
- Deployment quality
- Attention to detail
- Ability to work independently as a solo developer
